# HW 02 – Multiple Screens

I made a basic calculator, I put two text fields and and get 2 integers, between them I put a label and label shows the user which mathematical operations they are doing (the label is invisible at first). I put 5 buttons for add, minus, divide, multiply and clear. When the user writes two integers the code works correctly but if the user gives us empty fields or string the result is 0. The clear button changes integers and label between the integers as empty and basically clears the operation.

We assume that user gives as two integers and push the add button; the label between textfields will be visible as "+" and the two integers will be added in ViewController and will be send to the other viewcontroller which name is Sum in my project. And the result of the operation will be shown at that page. I used performSegue and Prepare function for this project.
